

Plain Gypsum Ceiling Tiles

Knauf Plain Gypsum Ceiling Tiles are perforated and non-acoustical. These tiles are produced in two types: Non-laminated and laminated (PVC and/or aluminum foil laminated). Non-laminated tiles can be easily painted according to the user's desire. PVC laminated tiles do not need painting and therefore can be installed with a higher speed. Aluminum back laminated tiles are suitable for humid areas, where the possibility of condensation exists. Also, these tiles are used in areas where a risk of water leakage exists (e.g. piping ducts)
